

Israel said to brace nuclear reactors for Iranian, Hezbollah missile attacks

Dimona reactor

The Israel Atomic Energy Commission (IAEC) has been working to secure the Dimona and Nahal Sorek nuclear reactors against possible missile strikes from Iran and Hezbollah, according to a report by the *Haaretz* daily on Thursday.

Missile strikes are the greatest immediate threat to Israel's nuclear production infrastructure, members of the IAEC told *Haaretz*.

Commission members have stated that the dangers posed to civilians are primarily are psychological, meaning that while Israelis would not face physical

danger in the event that a nuclear reactor is hit by a missile, it would be a major propaganda victory for enemies of the Jewish state.

An IAEA senior official told *Haaretz* that the commission had relocated its headquarters from North Tel Aviv to nearby the Nahal Sorek facility, stating that employees will be safe in the event that Nahal Sorek is hit.

The IAEA recognizes that an attack on one of Israel's nuclear sites could inspire widespread fear, and it is preparing to correctly address and explain any situation that may arise, *Haaretz* reported.

Last year at a Beirut rally commemorating the death of Hezbollah's former leader Imad Mughniyeh, current leader Hassan Nasrallah took credit for the closing of an ammonia tank in Haifa after his organization had threatened to target it.

"I call upon Israel not only to evacuate the ammonia tank from Haifa, but also to dismantle the Dimona nuclear facility," Nasrallah said at the rally last year.

"The Israeli nuclear weapon that represents a threat to the entire region, we will

turn it into a threat to Israel," he declared.

Whether or not Hezbollah directly influenced the closure of Haifa's ammonia storage facility cannot be determined.

However, the Haifa Court of Local Affairs ruled that the owners of the facility empty the tank following a report in January 2017 that said thousands of Israelis living around the facility would be die if exposed to the contents on the tank, either by accident or as a result of a Hezbollah missile strike.

This ruling was later upheld by the Israeli Supreme Court.

Israel's military believes Hezbollah has between 100,000 and 120,000 short- and medium-range missiles and rockets, as well as several hundred long-range missiles, with the medium-range missiles capable of reaching Tel Aviv.
